The Often-Overlooked Consequences of Violence

People who experience domestic violence or sexual assault often describe abuse that inflicts bruises, cuts, or broken bones. A common but often unspoken injury is traumatic brain injury (TBI). TBIs that occur in the context of interpersonal violence constitute blunt force trauma to the brain which can be caused by being hit in

the head, throat or neck, thrown against a wall or hard object, strangled (“choking”), or lost consciousness. TBIs often go unrecognized because the primary focus is on the violence itself and the overall trauma that survivors have experienced. Disability Rights Wisconsin (DRW) developed this document to raise

awareness of and enhance responses to TBIs acquired as a result of domestic or sexual violence.

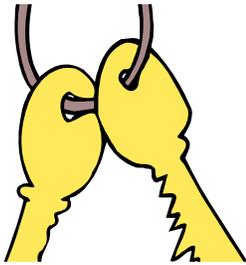

Short and Longer Term Consequences of TBI

The effects of a TBI vary from person to person. Some common symptoms include decreased concentration or attention span (cognitive effects), increased anxiety or agitation

(behavioral effects) and headaches or dizziness (physical effects). An important issue impacting victims/survivors of violence is understanding the increased risk that occurs when a

person experiences one TBI. The risk of another TBI increases due to slower reaction time, impaired judgment or inattentiveness to factors that might lead to a repeat TBI.

Screening for TBI is the key to survivors accessing needed specialized services.

An important issue regarding TBI is the increased risk that occurs when a person experiences one TBI.

Helping survivors on their path to hope and healing.

What Advocates Might Notice...

Victims of violence who have a TBI might find it difficult to do many of the things that would help with both their immediate and longer-term safety. TBIs affect cognition, behavior and physical functioning. Here are some examples of what

you might notice a victim who has a TBI has difficulty with: assessing danger (e.g., knowing when the abuser's violence is escalating); defending against or escaping from immediate physical danger; judging when she

needs to seek medical attention; making and remembering safety plans; keeping advocacy or court appointments; or going to school or holding a job. Undiagnosed TBIs, therefore, can further trap a victim with the abuser.

Screening Questions to Identify TBI

Screen **everyone**. When a TBI is suspected, continue to provide services while also referring her for specialized TBI-related services. A simple and helpful tool you can use is the **HELPS**

tool. (See next page) It is designed to be used by people who are not TBI experts. **HELPS** is an acronym for the most important parts of screening: **H** = Hit on head; **E** = Emergency room

treatment; **L** = Loss of consciousness; **P** = Problems; and **S** = Sickness.

(The original HELPS TBI screening tool was developed by M. Picard, D. Scarisbrick, R. Paluck, 9/91, International Center for the Disabled, TBI-NET, U.S. Department of Education, Rehabilitation Services Administration, Grant #H128A00022; updated to reflect recent recommendations by the CDC on the diagnosis of TBI.)

Enhancing Effective Support and Response

Screening for TBI can be life saving since repeated head injuries decrease a person's ability to recover and increase that person's risk of death. Once a person has been screened, if

warranted, refer the survivor for specialized treatment. Your role as a domestic or sexual violence advocate remains vital. Ask about what support or reasonable accommodations she

might need to benefit most from your services. Be informed about available TBI resources and ways you can most effectively support her in her journey as a survivor of violence **and** TBI.

HELPS Screening Tool

H = Hit on head

- Have you ever been hit in the head or had your head slammed into a wall or hard object?
 - Have you ever been pushed so that you fell and hit your head?
- ___ Yes ___ No

E = Emergency Room

- Were you ever seen in an emergency room as a result of being hit or hurt by someone abusing you?
 - Please describe what injuries you had.
- ___ Yes ___ No

L = Lose consciousness

- Did you ever black out after having been hit in or around your head?
 - Have you ever lost consciousness? For how long? For what reason?
- ___ Yes ___ No

P = Problems

- Did you have any problems after you were hit on the head?
 - Headaches, dizziness?
 - Difficulty remembering, concentrating, reading, writing or doing math calculations?
 - Changes in your behavior, attitude or job performance?
- ___ Yes ___ No

S = Sickness

- Have you experienced any sicknesses after having hit your head?
- ___ Yes ___ No

How to Use the HELPS Screening Tool

If a person answers “yes” to any of the questions in **two or more categories**, it’s important for this victim/ survivor to get a **more specialized evaluation by a medical professional**. If the victim/survivor has experienced **repeated** head injuries, her ability to recover is at risk. Talk with her about your concerns, and encourage her to seek Immediate medical care. Connect her with a TBI organization for specialized support. See next page for WI TBI resources.

Brain Injury Alliance of Wisconsin

N63 W23583 Main Street, Suite A
Sussex, WI 53089

Help Line In-state and
Toll-free: 800-882-9282

The Brain Injury Alliance of Wisconsin (BIAW) is a non-profit organization that brings together people with brain injuries, their families, friends, and concerned professionals. BIAW's mission is the prevention of brain injury and the

full participation in life for individuals with brain injury.

BIAW provides services in five core areas: education, advocacy, prevention, information & resources, and support services throughout the State.

The Brain Injury Alliance of Wisconsin coordinates a statewide network of support groups, several of which BIAW helped to establish. [The BIAW website contains a searchable database for all support groups by location within Wisconsin.]

BIAW continues to assist our network by providing resources, new information, speakers on various topics, along with other services in order to afford survivors and their family mem-
